

Example. For a particular illness a patient should take 3 drugs every day: drug A, drug B and drug C. According to his age and his gender the following table describes the necessary quantity. Write down a program that allows to calculate and print the quantities of the three drugs if a user enters his age and his gender. Gender is represented as X. For a male (M) the value of X is $\frac{A}{2}$ and for a female (F) the value of X is $\frac{A}{3}$.

Print three separate functions for calculating the drug quantity and for determining the X value use switch statement. In the end, print out all the quantities for each drug type and they should be displayed as only two digits after the decimal point.

Age Range	Drug A	Drug B	Drug C
age < 18	25 mg	2A mg	30 + B – 1.5X
18 <= age < 65	45 mg	5A mg	40 + 2B – 3X
age >= 65	30 mg	3A mg	35 + B – 2.5X

```
>> Enter your age: 37
>> Enter your gender: M
Drug A: 45.00
Drug B: 225.00
Drug C: 422.50
```
