

CSE 114 - Fundamentals of Computer Programming – 2026 Spring

Hw 5

We used the following approach in the class to count a number in an array.

```
int index_of_last( const int A[], int size, int n ){
    for( int i = size-1; i >= 0; i-- ){
        if( A[ i ] == n ){
            return i;
        }
    }
    return -1;
}

int count_new( const int A[], int size, int n ){
    int count = 0, index;
    index = index_of_last( A, size, n );
    while( index != -1 ){
        count++;
        index = index_of_last( A, index, n );
    }
    return count;
}
```

Write the two functions to solve the same problem the other way; namely,

```
int index_of_first( const int A[], int size, int n )
int count_with_first( const int A[], int size, int n )
```

The first function will return the index of the first occurrence of n, not last. The second function should use this function.

Submission – Write a single C program for all parts and submit your file with the given format:
